About us

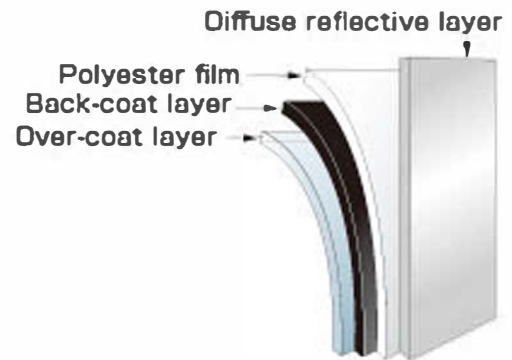

We offer the finest finished products to enhance your presentation. To maintain your competitive edge in the business world, your messaging must be displayed on superior screen material. Our material is designed with the greatest consistency and quality ensuring a perfectly flat viewing surface without any creases or wrinkles. Our projection screen vinyl materials are manufactured with many different qualities which result in great color reproduction.

CONTRAST WHITE (CW)

Our Contrast White or CW is our super lightweight, high luminance vinyl film projection screen material. With zero texture and ambient light rejecting surface it offers a gain of 1.3, and designed to perform in a wide range of lighting situations. In particular it deflects ambient light away from the screen for a brighter and broader viewing image. Our design incorporates a diffusive reflection layer allowing for a high luminance and a lightweight polyester film backed with a black-back coat layer preventing any light penetration. An over-coat layer for added protection is added to the reflective layer when rolled.
